  - **Best Seismic Data Outcome**

# CGC Seismic Services

## Seismic Feasibility Services (SFS)

2D seismic surveys are acquired to identify basins and their geometries. Though, seismic surveys are the best ground truth one can establish, they come with an inherent risk of failing to deliver their aims due to extremely poor data quality. Such outcomes can be particularly costly for a company and often result in the survey being reshot or data being reprocessed several times.

CGC's seismic feasibility services are especially catered to giving independent advice to oil and gas companies on eliminating or significantly reducing risks associated with data quality of a 2D seismic survey in a block.

- SFS include a comprehensive assessment of the target basin with respect to suitability of a 2D seismic survey.
- SFS informs the client of the expected data quality from a planned 2D seismic survey in relation to the target.
- Informs the client about the best survey options (frequencies and acquisition instruments) that would be best suitable for a given basin.
- It proposes the client the acquisition geometry specifics (line lengths, orientations, spacing) for an area.

### **SFS takes into view the uniqueness of your basin.**

SFS services are delivered within five working days for a block size of 10,000 sq km. and employ CGC's top seismic professionals.

**If you would like to be sure of your decisions on a planned 2D seismic survey, do give us a call or drop us a line.**
